

Never hand over

This isn't "AI is dangerous, be careful" — you've heard that enough. These are three specific categories with a clear test for each. Recognise them and you can move fast on everything else without worrying.

What each one actually catches

TEST	THE FAILURE IT PREVENTS
Data	Customer records, unreleased financials, anything under NDA — pasted into a tool nobody approved. This is about <i>which tool</i> , not about AI generally: the version your company pays for handles data differently from the free one.
Judgment	Performance reviews, difficult feedback, hiring calls. Tightening a paragraph you already mean is fine. Asking it what you think about someone is not.
Checkable	Confident, articulate output in an area you don't know well, forwarded because it read well. Confidence in the output is not evidence.
a	Test three gets more important as models improve, not less. The output keeps getting more plausible. Your ability to check it doesn't automatically keep up.
b	Approved does not mean checked. Approving a tool says the data is handled properly. It says nothing about whether you should delegate a decision that's genuinely yours.
