

Spot the work **worth** automating

Most people try AI on the biggest, most important thing on their plate. It does a mediocre job, and they decide the tool isn't ready. The tool was fine — the pick was wrong. Three questions tell you what's actually worth building once.

Worked examples

TASK	VERDICT	WHY
Weekly status roll-up	Build it	Comes back weekly, identical structure, and about ninety percent of the work is moving text between tabs.
Performance review	Keep it	Comes back and has a fixed form — but the value <i>is</i> your judgment. Two out of three is a no.
Monthly reconciliation	Build it	Same sources, same output, every month. Judgment is only in what you do about the mismatches.

- a** **Question three is the one people skip.** It's uncomfortable. It's easier to believe all of your work requires your judgment. Most of it doesn't, and being honest about that is what frees up the hours.
- b** **Start with the most repetitive, not the most important.** Those are different axes. You want the boring one first, because if it breaks, nothing bad happens.
