

The one-time setup

No new tools, no automation platform, no IT ticket. If your company gave you ChatGPT, Claude, or Gemini, you already have everything this needs. Each one has a place to store standing context so it's loaded before you type anything — you just have to put it there once.

TOOL	WHAT IT'S CALLED	WHERE THE CONTEXT GOES
ChatGPT	Projects	The custom instructions field on the project
Claude	Projects	Project instructions, plus files for reference material
Gemini	Gems	The Gem's instructions

THE FIVE-STEP SETUP

- 1 One project per recurring job. Name it after the job, not after the tool.
- 2 Standing context goes in the instructions field — the never-changes half of your brief.
- 3 Reference examples go in as files. Approved material only.
- 4 Each run: paste the new material, nothing else.
- 5 Share it with whoever else does the same job.

- a **One project per job, not one giant project called Work.** The value is that the context is specific. Something that knows about your roll-up and your reconciliation and your client emails knows nothing precisely.
- b **Sharing is where it stops being a personal trick.** Hand the project to a teammate and they produce the same thing to the same standard without you explaining it.
- c **It's a living thing.** When something comes back wrong, go edit the project instructions. Five seconds now, or the same annoyance every week forever.

Only put in material you'd be comfortable with the tool holding — approved tool, appropriate documents.
